Abstract

Introduction. Emotinal Regulation Checklist is frequently used to determine emotional developments of children by teacher and parents of children. The purpose of this study was to examining the Psychometric Properties of *Emotinal Regulation Check List* for 4-5 years age in preschool children.

Method. The sample of the research was composed of 600 preschool children, who are all 4-5 years old, from 13 different public schools in Eskişehir (Turkey). This study is a quantitative and relational study. The data were collected by *Emotinal Regulation Check List* and *Pre-School Social Competence and Behavior Evaluation Inventory-Teacher Form*.

Results. The factor structure of the scale was tested through confirmatory factor analysis (CFA) and the results indicate that the original factor model did not fit the data. Exploratory factor analysis (EFA) results differed from the original study in that item twelve took place in the first factor. CFA results revealed an acceptable model fit and suggested that two factor model was confirmed with the second dataset. Cronbach Alpha internal consistency coefficients were acceptable for subscales. Positive and negative medium level meaningful relations were found between emotion regulation checklist sub-factors and social competence and behavior the sub-factors.

Discussion and Conclusion. As a result of, it can be concluded that scale is a reliable and valid measurement tool for measure the emotion regulation behaviors of 4-5-year-old children. The findings of this study indicate the need to Education programmes developed to increase emotinal regulation of children, and their efficiency evaluated via this assessment instruments.

Keywords: preschool education, emotional regulation, social competence, social behavior.

Resumen

Introducción. Las listas de comprobación regulación de las emociones para determinar el desarrollo del sentimiento de los niños, se utiliza con frecuencia por los niños, profesores y padres. El objetivo de este estudio estuvo centrado en niños de edad preescolar pertenecientes a una de lista de verificación de la regulación emocional, para evaluar las propiedades psicométricas.

Método. La muestra del estudio consiste en, en el grupo de 4-5 años de edad, Turquía / Participaron trece escuelas diferentes antes de asistir a instituciones educativas, con 600 niños. Esta estudio investigación relacional es cuantitativa. Los datos de la investigación fueron recolectados a través de un "Listado de Regulación de Emocionesl ", un "Inventario de habilidades socias" y una "Escala de comportamiento, calificado por el professor".

Resultados. Modelos a escala de la idoneidad de la estructura factorial y la validez de constructo se analizó mediante análisis factorial confirmatorio (CFA); sin embargo, se encontró que la escala para estar en conformidad con el modelo original del factor de estructura. En el análisis factorial exploratorio, en una escala diferente de la estructura factorial original del segundo elemento que se encuentra en el primer factor. CFA resultados revelaron que un modelo aceptable apropiado y se confirmaron mediante el modelo de dos factores el segundo conjunto de datos. Se encontró coeficiente de consistencia interna Cronbach Alpha aceptable. Las relaciones significativas nivel medio positivas y negativas se encontraron entre la lista de control de regulación emocional subfactores y la competencia social y el comportamiento de los subfactores.

Discusión y Conclusión. El estudio concluyó que la escala es una herramienta de medición válido y fiable para medir el comportamiento de regulación de las emociones de los niños de 4-5 años de edad. Los resultados del estudio mostraron que se necesita regulación de las emociones para mejorar de sus hijos en el desarrollo de programas educativos y la eficacia de los programas de formación pueden ser evaluados por el instrumento de medición.

Introduction

Pre-school age is the period in which the development of children is the most rapid and the most critical. Pre-school period is significant in emotional development similar to other areas of development. Piaget (1965) identified the pre-school period as the age of curiosity. In this period, the child learns about the surrounding complex social world through active experiences. The foundation of emotional characteristics is laid in the pre-school period, and they affect the achievement of more complex social skills in the future. Children proceed to group socialization and interactive play with their peers from egocentric thoughts and behaviors during the pre-school period. Children transform from caretaker/parent relationship in customary domestic environment into a group socialization and interactive peer relationship in the school environment. During this change of interactions, it is expected from the child to learn social skills, to behave pro-social, to initiate friendships and play with her or his peers (Bronson, 2000; Davies, 2004).

One of the developmental tasks that affect the acquirement of these characteristics is the achievement of the ability to manage their emotions while conducting their relations with individuals outside their family by the children. Management of emotions is related to the emotional development of the child. Emotional development is the knowledge of the individual about the connection between her or his feelings and emotions, being in peace and in cohesion with her or his own self and the environment, and being able to control her or his emotions (Saarni, 2001). Emotions are directive, conductive, and sometimes preventive of our actions. Saarni (1999, pp. 344) defined emotion as “the attempts or preparation to establish, maintain or change relationships between the environment and the individual in issues significant for the individual.” Emotions are strong determinants of our actions in social situations; emotions conduct even determine social interactions and relationships (Denham, 2007; Saarni, 1999). Emotional competence is the individual’s ability to regulate one’s emotions to reach her or his goals. For pre-school children, emotional competence includes the abilities to express their emotions, to understand emotions, and to regulate emotions (Colwell & Hart, 2006; Eggum et al., 2011). Skills of understanding and regulating emotions are significant behavioral elements in individuals initiating and maintaining positive interactions with others (Vural and Gürşimşek, 2009). Early childhood is a critical period for the development of chil-

dren's understanding of emotions, emotion regulation skills, value systems and self-confidence social competence (Berk, 2000; Blair et.al, 2004; Carlson ve Wang, 2007)

Emotion regulation refers to “the processes by which individuals influence which emotions they have, when they have them, and how they experience and express these emotions” (Gross 1998, pp. 275). Emotion regulation is defined conceptually as the individual's ability to organize his or her emotional stimulations to achieve a compatible relationship with the environment (Shields & Cicchetti, 1997; Thompson, 1994). Emotion regulation is not only the ability to cope with negative emotions, but it is also the ability to maintain positive emotions (Denham, 1998; Hyson, 2004). Emotion regulation includes internal and external processes that does not only consist of reducing the emotion itself, the way it is perceived, its intensity and frequency, but to create and sustain the emotional response. Internal emotion regulation processes contain self-regulation of the individual's emotions, while the external processes entail someone else regulating the individual's emotions (Thompson,1994). Emotion regulation is critical both in initiating, motivating, and organizing adaptive behavior, and in preventing stressful levels of negative emotions and maladaptive behavior (Cicchetti, Ackerman, and Izard, 1995). Emotion regulation is important in the case of positive and negative emotions, and it becomes more crucial as the intensity of a given emotion increases (Sobanski et al., 2010). Effective emotion regulation has been linked with a number of positive emotional, social, and cognitive outcomes. Children that has the skill to regulate emotions could manage their emotions under every situation, reducing the possibility of exhibiting externalized and destructive behavior, and succeed in social and interpersonal relationships, and experience an increase in academic achievements (Howse et al., 2003; Luby, 2005). Variability/negativity is about children responding rapidly to emerging emotional stimulants and experiencing difficulties in recovering from negative emotional reactions (Dunsmore, Booker & Ollendick, 2011). Variability/negativity in emotion regulation is directly related to internal and external behavioral problems, failure in social competencies, and destructive behavior disorders (Denham, 1998; Eisenberg et al., 1995; Kim & Deater-Deckard, 2011; Shields & Cicchetti, 1998; Shields, Cicchetti & Ryan, 1994).

Postnatal development of emotion regulation begins in infancy and continues through toddlerhood and childhood with the support of parents, teachers, and other caregivers Trevarthen & Aitken, 2001). Emotion regulation at all ages is negatively correlated with internalizing symptoms, and successful regulators are less likely to show impulsive tendencies (Kim-

Spoon et al., 21013; Spinrad et al., 2006). As children age, they become more skillful in the area of emotion regulation and are less emotionally reactive (Morris et al., 2010; Spinrad et al., 2006). Pre-school children (aged 3 – 5) could increasingly determine their emotional experiences and recognize possible precursors and outcomes of emotional responses. Furthermore, these children could identify the situational determinants of emotional responses, read the emotional clues, and become competent in taking the emotional perspective of someone else. These skills empower the children in regulation of their emotional expressions and behavior, recognition, prediction, and reflection of different emotional experiences for conformity. For pre-school children to develop their emotion regulation skills, their educational environment should provide them opportunities of practicing these skills (Dickstein et. al., 2001; Dunn & Brown, 1993; Garner, Jones & Miner, 1994; Russell, 1990; Saarni, 1999). Lack of emotional competencies results in rejection of the children by their peers, solitude, social skill deficiencies, aggressiveness, antisocial behavior, and behavioral disorders, resulting in an increase in these problems in the future periods of development (Garner, 2010; Raikes & Thompson, 2006; Raver & Knitzer, 2002; Shackman et al., 2010). Identification of emotional competencies in pre-school children is significant for taking early precautions and implementation of preventive educational programs for affected individuals (Raikes & Thompson, 2006).

The aims

Purpose the main purpose of study was to adapt the Emotional Regulation Checklist for 4-5 year old children. The secondary purpose of the study was to investigate the whether relation between emotional regulation subdimensions and social competence- behaviour subdimensions of children.

Method

Participants

The universe of the study consists of children at the age group of 4-5 who attend pre-schools in Eskişehir/ Turkey city center. Before the scales were conducted, permission was obtained from Ministry of National Education, and teachers and parents of the children. The sample of the research was composed of 631 preschool children, who are all 4-5 years old, from 13 different public schools in Eskişehir, Turkey. Thirty one participants' scales were removed be-

fore the analyses, since the items in these scales were not scored appropriately. Hence, the dataset contained the data obtained about 600 preschool children. Validity and reliability studies of the scale were conducted according to data from the assessments of the teachers of 600 children. In Table 1 are the demographic characteristics of the children and their parents consisting the sample group.

Table 1. *Demographic Characteristics of the Sample Group*

<i>Scale</i>	<i>Variables</i>		N	%
Emotion Regulation Checklist	Gender	Girl	288	48.00
		Boy	312	52.00
	Age	4 age	232	38.7
		5 age	368	61.3

		Secondary education	247	41.17
University		243	40.50	
Master / PhD		30	5.00	

Instruments

Emotion Regulation Checklist. Emotion Regulation Checklist was developed by Shields & Cicchetti (1995) to assess the children's emotion regulation at the age of 5-12. Emotion Regulation Checklist administered to teachers, school counselors, and parents to children's emotion regulation. The Checklist consists of 24 items and items are scored on a 4-point Likert scale (1=Never; 2=Sometimes; 3=Often; 4=Almost always). The scale included two subscales, (i) Lability/Negativity and (ii) Emotion Regulation. The ERC emotion regulation subscale captures processes central to adaptive regulation, including socially appropriate emotional displays and empathy. The lability–negativity subscale assesses arousal, reactivity, anger dysregulation, and mood lability. To evaluate the factor structure of the ERC, we conducted a principal-components factor analysis using the current sample ($n = 322$). We first analyzed Time 1 data and replicated using Time 2 data (1-year follow-up data). This analysis yielded two separate factors of emotion regulation (with factor loadings ranging .42~.84 at Time 1 and .47~.85 at Time 2) and emotion lability/negativity (with factor loadings ranging

.29~.86 at Time 1 and .35~.86 at Time 2). The two factors were correlated at -.47 at both times. One item is not included in either subscale, as it has not loaded on either scale (Shields & Cicchetti, 1998; Kim-Spoon, Cicchetti, Rogosch, 2013). The Lability/Negativity subscale contains 15 items (Cronbach's alpha=.96) that refer to the child's tendency to become distressed; while the Regulation subscale contains eight items (Cronbach's alpha=.83) that assesses the appropriateness of the child's emotional displays (Shields & Cicchetti, 1997). The aggregation of these two subscales produces an emotion regulation composite score that captures both regulation and dysregulation of the emotions. The composite ERC score has been found to have an internal consistency of .89 by the developers of the scale (Kim-Spoon, Cicchetti, Rogosch, 2013; Shields & Cicchetti, 1998)

Pre-School Social Competence and Behavior Evaluation Inventory-Teacher Form.

The Social Competence and Behavior Evaluation Inventory – Teacher Form was developed by LaFreniere & Dumas, 1996). Observational data was supplemented with teacher ratings of affective expression, social competence and adjustment difficulties using SCBE. Children were assessed according to 5 of the basic scales of the SCBE: depressive, anxious, angry, isolated, and oppositional. Interrater reliability for the scales calculated using Spearman-Brown estimates are uniformly high, ranging from .72 to .89. Internal consistency of the scales as assessed with Chronbach's alpha is also uniformly high, ranging from .79 to .91. (Walter & LaFreniere, 2000). The scale adopted to Turkey by researchers for 4-5 age children. This scale was completed by teachers for 617 children. The data obtained from the teachers were divided into two groups and Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA) was conducted. Exploratory factor analysis (EFA) identified five factors accounting for 57.90 % of the variance for Social Competence and Behavior Evaluation Inventory-Teacher Form. The confirmatory factor analyses results indicated that the factor structure was partially consistent with the model. Cronbach Alpha internal consistency coefficients were .77 for general scale, were .92, .82, .73, .72 and .74 for subscales. Spearman-Brown coefficients were .88, .77, .70, .70 and .64 for subscales (Dereli- İman, Danişman, Yaya & Akın – Demircan, 2014).

Procedure

Turkish adaptation of Emotion Regulation Checklist was obtained through translate-retranslate study. So the checklist was translated into Turkish by the researchers. Same checklist was translated into Turkish by three English specialists. The conformity of the translation

of the researchers was compared with the other three translations. Three different specialists of the English specialists who translated the checklist into Turkish re-translated the Turkish versions of the checklist into English. The translations were reviewed by the researchers, and no meaning shift was detected. Thus, Turkish form of the checklist was ready to apply. The checklist was then presented to seven specialists who had doctorate degree in the field of pre-school education and child development education, and they were revised again based on the specialists' opinions. Teachers and parents of 50 children were asked to assess their children through the checklist in order to assess the understandability of them by teachers and parents, and then a pilot scheme was conducted.

Data Analysis

Examining the Psychometric Properties of the Emotional Regulation Checklist among 4-5 year age preschool Children, firstly checklist was determined abroad, and then confirmatory factor analysis was conducted in accordance with the items and the sub-factors. However, it was detected that the confirmatory factor analysis did not confirm for 4-5 year age preschool children in Turkey. Therefore, data from teachers were randomly categorized into two groups, and then Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) were done. The exploratory factor analysis was done with the 309 data and the confirmatory factor analysis was done with the 291 data (Fraenkel & Wallen, 1993; Şencan, 2005; Şimşek, 2007). Reliability of the checklist was tested Pearson Moment Correlation Coefficient, Spearman's Rank Correlation Coefficient, and Cronbach Alpha Coefficient. The correlation between the sub-factors of the checklist, the relationship Emotion Regulation Checklist and Social Competence and Behavior Evaluation Inventory-Teacher Form was tested the Pearson moment correlation coefficient analysis. Data were analysed the SPSS 21.0 and LISREL 8.51 package programmes.

Results

Study of Construct Validity

Exploratory Factor Analysis

After the data cleaning procedure, the two-factor structure of the scale was tested through confirmatory factor analysis to examine model fit for the scale and reveal the construct validity of the scale. The results indicate that the original two-factor model (excluding

item 12 as mentioned before) did not fit the data. Since the examination of the model fit did not result appropriately, exploratory factor analysis (EFA) was used to determine if there were plausible models explaining the relationships among all of the items. Aiming a new factor structure of the scale, we firstly divided the dataset into two parts; first part was for EFA and the second part was for CFA of the emerging model. Conformity of data with the principal components analysis was examined with *Kaiser-Meyer Olkin* (KMO) coefficient and the *Barlett Sphericity* test. As a result of the analysis, KMO value was 0.95, and the *Barlett Sphericity* test was meaningful ($\chi^2 = 12273.04$; $p < 0.01$). Thus, it can be said that data from the Checklist were suitable to tested exploratory factor analysis on. Factor analysis and Varimax rotation method based on Principal Components Analysis were used to reveal the factorial structures of the Checklist' items. In this study, all the communalities for the factor analysis satisfied the minimum requirement of being larger than .40 and which had a difference more than 0.10 between the loads in two separate factors (Bryman & Cramer, 1997; Büyüköztürk, 2002; Kline, 2005)

Table 2. *Structure Design of Emotion Regulation Checklist*

<i>Item</i>	<i>M</i>	<i>SD</i>	<i>Pre-loading values of rotation</i>	<i>Factor 1</i>	<i>Factor 2</i>
Exhibits wide mood swings (child's emotional state is difficult to anticipate because s/he moves quickly from positive to negative moods.	1.31	.616	.90	.92	
Transitions well form one activity to another; does not become anxious, angry, distressed or overly excited when moving form one activity to another.	1.26	.632	.88	.91	
Can recover quickly from episodes of upset or distress (for example, does not pout or remain sullen, anxious or sad after distressing events.	1.30	.603	.80	.90	
Is easily frustrated.	1.30	.618	.85	.94	
Is prone to angry outbursts/tantrums easily.	1.28	.654	.50	.54	
Is able to delay gratification.	1.32	.747	.72	.74	
Takes pleasure in the distress of other (for example, laughs when another person gets hurt or punished; enjoy teasing others).	1.48	.653	.75	.82	
Can modulate excitement is emotionally arousing situations (for example, does	1.31	.621	.64	.71	

not get 'carried away in high-energy play situations , or overly excited in inappropriate contexts).				
Is whiny or clingy with adults.	2.20	1.079	.59	.64
Is prone to disruptive outbursts of energy and exuberance .	1.49	.646	.64	.68
Responds angrily to limit-setting by adults.	1.30	.638	.72	.76
Is overly exuberant when attempting to engage others play.	1.32	.632	.71	.80
Responds negatively to neutral or friendly overtures by peers (for example, may speak in an angry tone of voice or respond fearfully)	1.48	.648	.74	.88
Is impulsive.	1.41	.645	.65	.67
Displays exuberance that others find intrusive or disruptive.	1.55	.632	.53	.58
Displays negative emotions when attempting to engage others play	1.53	.694	.57	.60
Is a cheerful child.	3.90	.637	.66	.67
Responds positively to neutral or friendly overtures by adults.	3.70	.670	.74	.78
Responds positively to neutral or friendly overtures by peers.	3.91	.640	.51	.52
Can say when s/he is feeling sad, angry or mad, fearful or afraid.	3.86	.660	.53	.56
Seems sad or listless.	3.78	.668	.65	.70
Displays flat affect (expression is vacant and inexpressive; child seems emotionally absent)	3.99	.687	.86	.88
Is empathic towards others; shows concern when others are upset or distressed.	3.88	.662	.95	.97
Display appropriate negative emotions (anger, fear, frustration, distress) in response to hostile, aggressive or intrusive acts by peers.	3.95	.677	.53	.59
The percentage of explained variance			81.12	53.99
<i>Total percent</i>			100	53.99
			27.13	27.13

This analysis resulted in two factors having eigenvalues greater than 1 and explaining the 81.12% of the total variance. Sixteen items loaded highly on the first factor, with loadings ranging from .54 to .94; while eight items loaded highly on the second factor, with loadings ranging from .52 to .97. Factor loadings of .71 or higher can be regarded as 'excellent', 0.63 as 'very good', .55 as 'good', .45 as 'fair', and .32 as 'poor (Comrey and Lee 1992).The first

factor can be named as Lability/Negativity, while the second one as Emotion Regulation in parallel with the original checklist. Our results differed from the original study in that item 12 took place in the first factor, whereas it was excluded from the subscales and included in the scale separately.

Correlations between the sub-factors of the scale were tested with Pearson moment correlation coefficient, and the scores were given in Table 3.

Table 3. *Descriptive Statistic and Intercorrelations Among the Sub-Dimensions of Emotion Regulation Checklist*

<i>Sub- Factor</i>	<i>M</i>	<i>SD</i>	<i>Lability/Negativity</i>	<i>Emotion Regulation</i>
Lability/Negativity	22.84	5.77	1	-.39**
Emotion Regulation	30.97	10.16	-.39**	1

** $p < .01$

In Table 3 are the relations between the sub-factors of Emotion Regulation Checklist. According to the findings of the analysis, negative and medium level relations were found between the sub-factor of Lability/Negativity and the sub-factors of Emotion Regulation. Those findings show that no multicollinearity was between the sub-factors of the scale.

Confirmatory Factor Analysis

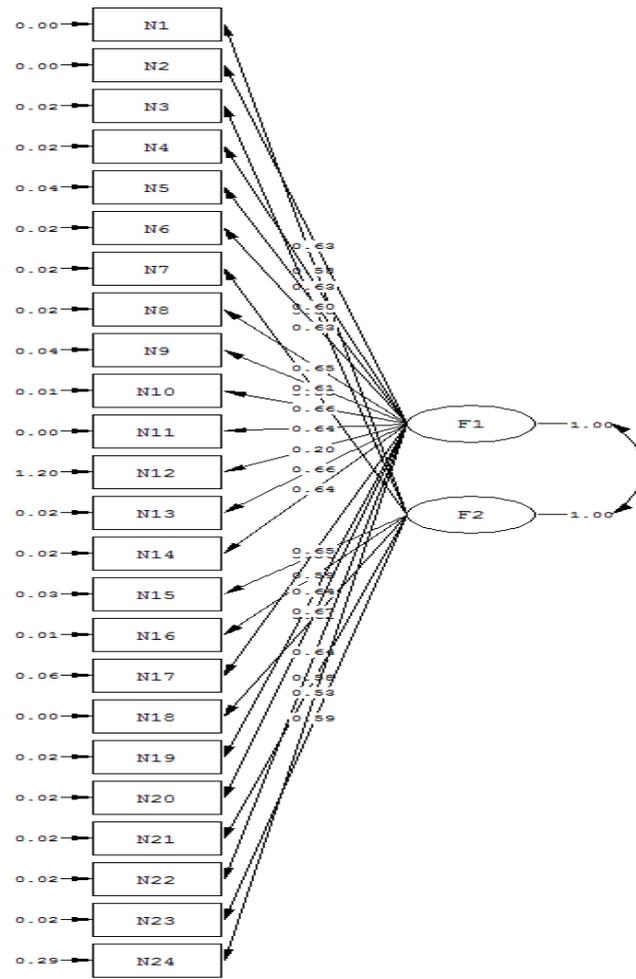

Confirmatory factor analysis, another type of construct validity study of the scale, was done with least squares method. In Table 4 are the fit indices related to the confirmatory factor analysis. As seen in the table, Chi-square value (χ^2) and statistical meaningfulness levels were calculated as [$\chi^2=710.57$, $df=251$; $p < .001$]. χ^2/df rate was 2.83. According to Kline (2005) and Jöreskog and Sörbom (2001), because that rate was under 3, data set had a good fit value.

Table 4. *Goodness of Fit Indices related to the CFA Model for Emotion Regulation Checklist*

GFI	.93
AGFI	.90
NFI	.95
IFI	.97
CFI	.97

RMSEA	.07
S-RMR	.06
Df	251
χ^2	710.57
χ^2/df	2.83

CFA indicates that the two-factor model fits the data well: RMSEA=0.07, NFI=0.95, CFI=0.97, GFI=0.93, AGFI=0.90, IFI=0.97, SRMR=0.06. The scale model is between the range of $0 \leq \text{RMSEA} \leq 0.05$, $0.97 \leq \text{NFI} \leq 1$; $0.97 \leq \text{CFI} \leq 1$; $0.95 \leq \text{GFI} \leq 1$; $0.90 \leq \text{AGFI} \leq 1$ and $0.95 \leq \text{IFI} \leq 1$ it demonstrates a perfect fit; and if it is between the range of $0.05 \leq \text{RMSEA} \leq 0.1$, $0.95 \leq \text{NFI} \leq 0.97$; $0.95 \leq \text{CFI} \leq 0.97$; $0.90 \leq \text{GFI} \leq 0.95$; $0.85 \leq \text{AGFI} \leq 0.90$ and $0.90 \leq \text{IFI} \leq 0.95$ it demonstrates an acceptable fit (Du Toit, Du Toit, Mels ve Cheng, 2008; Kline, 2005; Şimşek, 2007). When CFA results are evaluated according to these criteria, it is shown that the model is quite good. Given these indices and standardized values, it may be concluded that the model confirms the factor structure. The root mean square error approximation (RMSEA) in the fit indices was .07. So the scale-observed values of the scale showed that the data exhibited acceptable fit. (Du Toit et al., 2008; Kline, 2005; Schermelleh-Engel, Moosbrugger & Müller, 2003; Şimşek, 2007). In other words, that model obtained reveals that factors were confirmed by the data.

Chi-Square=710.57, df=251, P-value=0.00000, RMSEA=0.079

Figure 1. Results of Confirmatory Factor Analysis

Criterion validity of the Emotion Regulation Checklist

In this validity study, relation between the sub-dimensions of Emotion Regulation Checklist and the Pre-School Social Competence and Behavior Evaluation Inventory-Teacher Form was examined.

Table 5. Relationship between Emotion Regulation Checklist and Pre-School Social Competence and Behavior Evaluation Inventory-Teacher Form

Sub- Factor	Social Com- petence	Anxiety	Aggression	Withdrawing	Anger
Lability/Negativity	-.55**	.47**	.37**	.34**	.31*
Emotion Regulation	.41**	-.47**	-.32**	-.42**	-.31**

**p<.01

The relation between the scores of the sub-factors of Emotion Regulation Checklist and the scores of the sub-dimensions of Pre-School Social Competence and Behavior Evaluation Inventory-Teacher Form was examined in Table 5. Positive and negative medium level meaningful relations were found between emotion regulation checklist sub-factors and social competence and behavior the sub-factors.

Reliability of Pre-School Social Competence and Behavior Evaluation Inventory-Teacher Form

Reliability of the scale was tested by item-total correlations, Cronbach Alpha Coefficient, Split Half Coefficient and Test-retest methods. Relation between two measurements was done three weeks apart in the test-retest reliability of the Pre-School Social Competence and Behavior Evaluation Inventory-Teacher Form for Children was examined.

Table 6. *The Reliability Analysis of Pre-School Social Competence and Behavior Evaluation Inventory-Teacher Form*

<i>Sub-factor</i>	<i>Item number</i>	<i>Item-Total Correlation Ranges</i>	<i>Cronbach Alpha Coefficients</i>	<i>Spearman-Brown Coefficients</i>	<i>Test-Retest Correlation (n=110)</i>
Lability/Negativity	16	.42-.96	.98	.93	.83
EmotionRegulation	8	.75-.97	.98	.88	.91
Whole Scale	20	-	.88	-	.86

In Table 6, Cronbach Alpha coefficients calculated for the general scale and its sub-factors range between .88 and .98. Spearman-Brown Coefficients calculated for the sub-dimensions of the scale were between .88 and .93. Test-retest correlation coefficients calculated for the general scale and its sub-factors range between .83 and .91. Total correlation ranges of the items of the scale were .42 and .97.

Discussion

In the present research, validity of the Emotion Regulation Checklist for the children of the age group of 4-5 were analyzed with Exploratory Factor Analysis and the Confirmatory Factor Analysis. The two-factor structure of the scale was tested through confirmatory factor analysis to examine model fit for the scale and reveal the construct validity of the scale done (Büyüköztürk, 2002; Bryman & Cramer, 1997; Kline, 2005).

The results indicate that the original two-factor model (excluding item 12 as mentioned before) did not fit the data. Since the examination of the model fit did not resulted appropriately, exploratory factor analysis (EFA) was used to determine if there were plausible models explaining the relationships among all of the items (Bayram, 2010; Çokluk et al., 2010). Aiming a new factor structure of the scale, we firstly divided the dataset into two parts; first part was for EFA and the second part was for CFA of the emerging model. The EFA was performed using SPSS and this analysis resulted in two factors having eigenvalues greater than 1 and explaining the 81.12% of the total variance. The first factor can be named as Lability/Negativity, while the second one as Emotion Regulation in parallel with the original scale. Our results differed from the original study in that item 12 took place in the first factor, whereas it was excluded from the subscales and included in the scale separately. Item-factor structure obtained from the first analysis has been tested by CFA. The results revealed an acceptable model fit and suggested that two factor model was confirmed with the second dataset. Items of the scale are parallel to the sub-factors they are to test in the original version of the scale. Children's emotional behaviors in a society are influenced by the expectations and the behaviors of adults. Intercultural difference between the social constructs might cause an item to take in different factor structure (Butovskaya & Demianovitsch, 2010). Shields & Cicchetti, (1998) found that the psychometric characteristics of the scale were similar to consist of two factors structure. Molina, Sala, Zappulla, Bonfigliuoli, Cavioni, Zanetti, Baiocco, Laghi, Pallini, De Stasio, Raccanello ve Cicchetti (2014) adapted the same scale for preschool and primary school children to Italy. They found that similar to our study the item 12 took place in the Lability/Negativity factor and consist of two factors structure.

According to the results of analysis, negative and medium level relations were found between the sub-factor of Lability/Negativity and Emotion Regulation. Those findings show that no multicollinearity was between the sub-factors of the scale. Similarly, Shields & Cic-

chetti, (1998) found that negative and medium level relations were found between the sub-factor of Lability/Negativity and Emotion Regulation. Molina, Sala, Zappulla, Bonfigliuoli, Cavioni, Zanetti, Baiocco, Laghi, Pallini, De Stasio, Raccanello ve Cicchetti (2014) found that negative and medium level relations were found between the sub-factor of Lability/Negativity and Emotion Regulation in Italy.

Pearson product-moment correlation coefficient has been calculated between the Emotion Regulation Checklist and Social Competence and Behavior Evaluation Inventory-Teacher Form (LaFreniere & Dumas, 1996) to test the Criterion Related Validity of the scale. Both scales were conducted on the same sample of students. Since total score cannot be obtained from the scales, the correlation coefficients has been calculated between the subscales of those scales. There was found to be statistically meaningful relationships between the subscales. According to those findings, the scale can be said to be valid. Eisenberg et.al (1993) found that children with higher emotion lability/negativity show lower levels of competent social functioning. Miller, Gouley, Seifer, Dickstein & Shields found that children with dysregulation show more levels of anger and aggression. Also Calkins, Gill, Johnson, and Smith (1999); Cole, Zahn-Waxler, Fox, Usher, and Welsh (1996), Hanish et al., (2004) found that children with poor emotion regulation exhibit aggressive and under controlled behaviors in social interactions, experience isolation and rejection in peer contexts, no conflicts declared.

The internal consistency was found to be .88 (Cronbach alpha reliability coefficient) for 24-item Emotion Regulation Checklist, .98 for 16-item Lability/Negativity subscale and .98 for 8-item Emotion Regulation subscale. Item-total correlation coefficients were found to be ranging between .75 and .97 for the Emotion Regulation subscale; while they ranged between .42 and .96 for the Lability/Negativity subscale ($p < .001$). As a result of the reliability analyses, the Emotion Regulation Checklist is a reliable assessment instrument (Büyüköztürk, 2002; Bryman & Cramer, 1997; Kline, 2005). Shields & Cicchetti (1998) found that Cronbach Alpha coefficient for Lability/ Negativity .89 and for Emotion Regulation .82. Molina et. al, (2014) found that the Cronbach Alpha coefficient for Lability/ Negativity .72 and for Emotion Regulation .59.

Conclusion and Suggestions

In this research, it has been found that the Emotion Regulation Checklist are valid and reliable assessment instruments for children at the age group of 4-5. The following suggestions might be made based on that finding: Validity and reliability of Emotion Regulation Checklist can be analysed through studying with different age groups. Studies might be conducted to determine the factors that might affect emotion regulation of children. Education programmer might be developed to increase emotion regulation of children, and their efficiency might be evaluated via this assessment instruments.

Appreciation

This research is a summary of ESOGÜ BAP Project that grants directed and leader author by Assoc. Prof. Dr. Esra DERELİ İMAN and supported from Eskişehir Osmangazi University Commission of Scientific Projects (ESOGÜBAP; project code = 2013-218). Also this research was presented as orally 3rd International Symposium on Economics and Social Science Conference, July 22-24, 2015, Waseda University, Tokyo, Japan.
